Cepheus, Draco, Ursa Major, and Ursa Minor.

Circumpolar constellations - Constellation Guide

In astronomy, a circumpolar constellation is a constellation (group of stars) that never sets below the horizon, as viewed from a location on Earth. Due to Earth's rotation and axial tilt with respect to the Sun, the stars and constellations can be divided into two categories. Those stars and constellations that never rise or set are called circumpolar.

constellations, the ones that, although their positions do change with time, they seem to travel in a circle centered at the sky's north pole, and are always visible from our northern latitudes. Most evident is the Big Bear, Ursa Major.

The Circumpolar Constellations

A circumpolar star is a star, as viewed from a given latitude on Earth, that never sets below the horizon due to its apparent proximity to one of the celestial poles. Circumpolar stars are therefore visible from said location toward the nearest pole for the entire night on every night of the year (and would be continuously visible throughout the day too, were they not overwhelmed by the Sun's ...
